Question

A product is made by mixing three raw materials 1, 2, 3 in varying proportions, where material 1 must account for not more than 50% of the total. If x, y and z are the amounts of raw materials 1, 2, 3, respectively, this constraint can be modeled as (2007 PI)

- $x \leq 0.5$
- $x \leq 0.5(x + y + z)$
- $0.5x \leq x + y + z$
- $x \geq 0.5(y + z)$

solution

Given,
Raw Materials: 1,2,3
Amount: x,y,z
let,
Total amount of Product: T

$$T = x + y + z \tag{1}$$

given constraint: Material one (x) must not account for more than 50% of the total.

$$x \leq 0.5(T) \tag{2}$$
$$x \leq 0.5(x + y + z) \tag{3}$$
$$x \leq y + z \tag{4}$$

Correct Option: b

Python Code

```
import matplotlib.pyplot as plt
import numpy as np

y = np.linspace(0, 10, 20)
z = np.linspace(0, 10, 20)
Y, Z = np.meshgrid(y, z)
# The boundary is x = y + z
X = Y + Z

fig = plt.figure(figsize=(10, 7))
ax = fig.add_subplot(111, projection='3d')
```

Python Code

```
surf = ax.plot_surface(X, Y, Z, alpha=0.5, cmap='viridis')

# Labeling
ax.set_xlabel('Amount of X (Material 1)')
ax.set_ylabel('Amount of Y (Material 2)')
ax.set_zlabel('Amount of Z (Material 3)')
ax.set_title('Boundary Plane: x = 0.5(x + y + z)')

plt.show()
```
