## Question:

For a real symmetric matrix  $\mathbf{A}$ , which of the following statements is true?

- a) The matrix is always diagonalizable and invertible.
- b) The matrix is always invertible but not necessarily diagonalizable.
- c) The matrix is always diagonalizable but not necessarily invertible.
- d) The matrix is always neither diagonalizable nor invertible.

## Solution:

Checking for diagonalizability of matrix  $\mathbf{A}$  given,

$$\mathbf{A} = \mathbf{A}^\top \quad (0.1)$$

$\therefore$  eigenvalues of  $\mathbf{A}$  are real.

for distinct eigenvalues  $\lambda_i, \lambda_j$  corresponding eigenvectors are  $\mathbf{x}_i, \mathbf{x}_j$ .

$$\mathbf{A}\mathbf{x}_i = \lambda_i\mathbf{x}_i \quad \text{and} \quad \mathbf{A}\mathbf{x}_j = \lambda_j\mathbf{x}_j \quad (0.2)$$

$$\mathbf{x}_j^\top \mathbf{A}\mathbf{x}_i = \lambda_i \mathbf{x}_j^\top \mathbf{x}_i \quad (0.3)$$

$$(\mathbf{A}\mathbf{x}_j)^\top \mathbf{x}_i = \lambda_j \mathbf{x}_j^\top \mathbf{x}_i \quad (0.4)$$

$$\therefore \mathbf{A}\mathbf{x}_j = \lambda_j\mathbf{x}_j \quad (0.5)$$

$$\lambda_j \mathbf{x}_j^\top \mathbf{x}_i = \lambda_i \mathbf{x}_j^\top \mathbf{x}_i \quad (0.6)$$

$$(\lambda_j - \lambda_i) \mathbf{x}_j^\top \mathbf{x}_i = 0 \quad (0.7)$$

$$\lambda_i \neq \lambda_j \quad (0.8)$$

$$\mathbf{x}_j^\top \mathbf{x}_i = 0 \quad (0.9)$$

$\therefore$  eigenvectors are orthogonal

$\therefore$  We can construct an orthogonal matrix with these eigenvectors

$$\mathbf{Q} = [\mathbf{x}_1 \ \mathbf{x}_2 \ \mathbf{x}_3 \ \dots \ \mathbf{x}_n] \quad (0.10)$$

$$\mathbf{Q}^\top \mathbf{Q} = \mathbf{I} \quad (0.11)$$

$$\mathbf{A} = \mathbf{Q}\mathbf{M}\mathbf{Q}^\top \quad (0.12)$$

Where  $\mathbf{M}$  is diagonal matrix with it's entries as eigen values of matrix  $\mathbf{A}$

The eigenvalues are placed in the same order as their corresponding eigenvectors  $\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_n$

$$M = \begin{pmatrix} \lambda_1 & 0 & \cdots & 0 \\ 0 & \lambda_2 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & \lambda_n \end{pmatrix} \quad (0.13)$$

where  $\lambda_1, \lambda_2, \dots, \lambda_n$  are eigen values of  $\mathbf{A}$   
 $\therefore \mathbf{A}$  is always diagonalizable.

Checking for invertibility of Matrix  $\mathbf{A}$ :

$$\mathbf{A} = \mathbf{Q}\mathbf{M}\mathbf{Q}^\top \quad (0.14)$$

$$|\mathbf{A}| = |\mathbf{Q}||\mathbf{M}||\mathbf{Q}^\top| \quad (0.15)$$

$$|\mathbf{A}| = M_1 M_2 \cdots M_n \quad (0.16)$$

where  $M_1, M_2, \dots, M_n$  are diagonal entries of Matrix  $\mathbf{M}$ .  
 $\mathbf{A}$  is invertible only when

$$\det(\mathbf{A}) \neq 0 \quad (0.17)$$

that is  $M_1, M_2, M_3 \cdots M_n \neq 0$

that is none of its eigenvalues are zero

if  $\lambda_i = 0$

then  $A$  is non-invertible

$\therefore$  a real symmetric matrix may or may not be invertible.

$\therefore$  Option c is correct.

Example of a real symmetric matrix  $\mathbf{A}$ :

$$\mathbf{A} = \begin{pmatrix} 1 & 1 \\ 1 & 1 \end{pmatrix} \quad (0.18)$$

$$\mathbf{A} = \mathbf{A}^\top \quad (0.19)$$

$\mathbf{A}$  is symmetric and diagonalizable but not invertible as  $\det(\mathbf{A}) = 0$
